

Instruction

Using industrial grade chips, high-precision imported SHT20 temperature and humidity sensor ensures excellent reliability, high precision and interchangeability. Adopt RS485 hardware interface (with lightning protection design), the protocol layer is compatible with standard industrial Modbus-RTU protocol. This product integrates MODBUS protocol and common protocol. Users can choose communication protocol by themselves. The common protocol has automatic upload function (connecting RS485 will automatically output temperature and humidity through serial port debugging tool).

Feature:

DC power supply: DC5-30V

Output signal: RS485 signal

Communication protocol: Modbus-RTU protocol and custom common protocol

Communication address: 1-247 can be set, default 1

Baud rate: can be set, default 9600, 8-bit data, 1 stop, no parity

Temperature accuracy: $\pm 0.5^{\circ}\text{C}$ (25°C)

Humidity accuracy: $\pm 3\%\text{RH}$

Temperature range: $-40^{\circ}\text{C} \sim +60^{\circ}\text{C}$

Humidity range: $0\%\text{RH} \sim 80\%\text{RH}$

Temperature resolution: 0.1°C

Humidity resolution: $0.1\%\text{RH}$

Device power consumption: $\leq 0.2\text{W}$

Wiring:

Size:

Standard 35mm rail mounting for direct mounting to standard DIN35 rails

Function code used by the product:

0x03: read holding register

0x04: Read input register

0x06: Write a single holding register

0x10: Write multiple holding registers

| Register type | Register address | Data content | Number of bytes |
|------------------|------------------|--------------------------------|-----------------|
| Input register | 0x0001 | Temperature value | 2 |
| | 0x0002 | Humidity value | 2 |
| Holding register | 0x0101 | Device address (1~247) | 2 |
| | 0x0102 | Baud rate 0:9600 1:14400 | 2 |

| | | | |
|--|--------|--|---|
| | | 2:19200 | |
| | 0x0103 | Temperature correction value (/10) -10.0~10.0 | 2 |
| | 0x0104 | Humidity correction value (/10) -10.0~10.0 | 2 |

MODBUS command frame

The host reads the temperature command frame (0x04):

| Slave address | Function code | Register address High byte | Register address Low byte | Number of registers High byte | Number of registers Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|---------------|--------------|
| 0x01 | 0x04 | 0x00 | 0x01 | 0x00 | 0x01 | 0x60 | 0x0a |

Slave response data frame:

| Slave address | Function code | Number of bytes | temperature High byte | temperature Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|-----------------|-----------------------|----------------------|---------------|--------------|
| 0x01 | 0x04 | 0x02 | 0x01 | 0x31 | 0x79 | 0x74 |

Temperature value = 0x131, converted to decimal 305, actual temperature value = $305 / 10 = 30.5\text{ }^{\circ}\text{C}$

Note: The temperature is a signed hexadecimal number, the temperature value is 0xFF33, converted to decimal -205, the actual temperature = $-20.5\text{ }^{\circ}\text{C}$;

The host reads the humidity command frame (0x04):

| Slave address | Function code | Register address High byte | Register address Low byte | Number of registers High byte | Number of registers Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|---------------|--------------|
| 0x01 | 0x04 | 0x00 | 0x02 | 0x00 | 0x01 | 0x90 | 0x0A |

Slave response data frame:

| Slave address | Function code | Number of bytes | temperature High byte | temperature Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|-----------------|-----------------------|----------------------|---------------|--------------|
| 0x01 | 0x04 | 0x02 | 0x02 | 0x22 | 0xD1 | 0xBA |

Humidity value = 0x222, converted to decimal 546, actual humidity value = $546 / 10 = 54.6\%$;

Continuous reading of the temperature and humidity command frame (0x04):

| Slave address | Function code | Register address High byte | Register address Low byte | Number of registers High byte | Number of registers Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|---------------|--------------|
| 0x01 | 0x04 | 0x00 | 0x01 | 0x00 | 0x02 | 0x20 | 0x0B |

Slave response data frame:

| Slave address | Function code | Number of bytes | temperature High byte | temperature Low byte | Humidity High byte | Humidity Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|-----------------|-----------------------|----------------------|--------------------|-------------------|---------------|--------------|
| 0x01 | 0x04 | 0x04 | 0x02 | 0x22 | 0x02 | 0x22 | 0x2A | 0xCE |

Read the contents of the holding register (0x03):

Take the slave address as an example:

| Slave address | Function code | Register address High byte | Register address Low byte | Number of registers High byte | Number of registers Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|---------------|--------------|
| 0x01 | 0x03 | 0x01 | 0x01 | 0x00 | 0x01 | 0xD4 | 0x36 |

Slave response data frame:

| Slave address | Function code | Number of bytes | Slave address High byte | Slave address Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|-----------------|-------------------------|------------------------|---------------|--------------|
| 0x01 | 0x03 | 0x02 | 0x00 | 0x01 | 0x30 | 0x18 |

Modify the contents of the holding register (0x06):

To modify the slave address as an example:

| Slave address | Function code | Register address High byte | Register address Low byte | Register value High byte | Register value Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|--------------------------|-------------------------|---------------|--------------|
| 0x01 | 0x06 | 0x01 | 0x01 | 0x00 | 0x08 | 0xD8 | 0x30 |

Modify slave address: 0x08 = 8

Slave response frame (same as send):

| Slave address | Function code | Register address High byte | Register address Low byte | Register value High byte | Register value Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|--------------------------|-------------------------|---------------|--------------|
|---------------|---------------|----------------------------|---------------------------|--------------------------|-------------------------|---------------|--------------|

| | | | | | | | |
|------|------|------|------|------|------|------|------|
| 0x01 | 0x06 | 0x01 | 0x01 | 0x00 | 0x08 | 0xD4 | 0x0F |
|------|------|------|------|------|------|------|------|

Continuously modify the holding register (0x10):

| Slave address | Function code | Starting address High byte | Starting address Low byte | Number of registers High byte | Number of registers Low byte | Number of bytes | Register 1 High byte | Register 1 Low byte | Register 2 High byte | Register 2 Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|-----------------|----------------------|---------------------|----------------------|---------------------|---------------|--------------|
| 0x01 | 0x10 | 0x01 | 0x01 | 0x00 | 0x02 | 0x04 | 0x00 | 0x20 | 0x25 | 0x80 | 0x25 | 0x09 |

Modify slave address: 0x20 = 32

Baud rate: 0x2580 = 9600

Slave response frame:

| Slave address | Function code | Register address High byte | Register address Low byte | Number of registers High byte | Number of registers Low byte | CRC High byte | CRC Low byte |
|---------------|---------------|----------------------------|---------------------------|-------------------------------|------------------------------|---------------|--------------|
| 0x01 | 0x10 | 0x00 | 0x11 | 0x00 | 0x04 | 0xD4 | 0x0F |

Normal version agreement:

The baud rate defaults to 9600 (user can set it by itself), 8-bit data, 1 bit stop, no parity

RS485 communication

| Serial command | Description |
|----------------|--|
| READ | Trigger a temperature and humidity report (27.4 ° C, 67.7% temperature 27.4 ° C humidity 67.7%) |
| AUTO | Start the automatic temperature and humidity reporting function (27.4 ° C, 67.7% temperature 27.4 ° C humidity 67.7%) |
| STOP | Stop temperature and humidity automatic reporting |
| BR:XXXX | Set baud rate 9600~19200 (BR: 9600 baud rate is 9600) |
| TC:XX.X | Set temperature calibration (-10.0~10.0) |
